Southwest Storms Fill a Reservoir—and Bring Flood Risk

NASA satellite images show Navajo Reservoir rising fast after heavy rains, a reminder that drought relief can arrive with danger.

A desert reservoir appears much fuller as storm runoff flows into it from several rivers.

Heavy rain in the U.S. Southwest sent water rushing into Navajo **Reservoir**, a large lake that stores water behind a dam, in late October and early November. According to NASA Earth Observatory, **satellite** images showed the reservoir in northern New Mexico and southern Colorado rising by nearly 60 feet between September 20 and November 7. That is about the height of a six-story building.

The change happened after back-to-back extreme rain events soaked the Four Corners region, where Arizona, Colorado, New Mexico, and Utah meet. The storms helped ease short-term **drought**, which means a recent lack of rain or snow. But the same storms also pushed some rivers to record or near-record levels and caused damaging floods. This is the hard part of water in a dry region: too little water is a problem, but too much water arriving too fast is also a problem.

NASA's view came from Landsat 9, a satellite that orbits Earth and takes images of land and water. Its camera, called the Operational Land Imager, can show changes that are hard to see from the ground. On September 20, Navajo Reservoir held only 60 percent of its average **capacity** for that date. By November 7, it stood at 108 percent of its average capacity for that date, its highest level since August 2019. That does not mean the reservoir was 108 percent full. It means it held more water than is typical for that time of year.

The reservoir had stayed low earlier in the year because of snow drought across the West. Snow drought means mountain snowpack is much lower than usual. In many western watersheds, a **watershed** is an area where water drains into the same river or lake, spring **snowmelt** often helps refill rivers and reservoirs. In 2026, there was not much spring growth in the lake. Then fall rain changed the picture quickly.

Several rivers, including the San Juan and Piedra, swelled with **runoff**, which is water flowing over land into streams and rivers. Pagosa Springs, Colorado, along the San Juan River, was hit especially hard. NASA reported that 5.05 inches of rain fell there in the first round of storms. On October 23, the river reached major

flood stage, meaning the water was high enough to cause serious flooding. After more rain, it rose again on November 1, almost reaching the record set in 1911.

Across parts of southwest Colorado, southeast Utah, northern Arizona, and northwest New Mexico, **rainfall** from early September through early November was 2 to 4 times the average. The U.S. Drought Monitor, a weekly report that uses satellite data and ground observations, showed improvement after the storms. Its November 3 summary said short-term drought had ended for the Southwest and Great Basin, though long-term drought still remained in some places.

Scientists also linked the wet pattern to El Niño, a **climate** pattern in the tropical Pacific Ocean that can affect weather far away. During El Niño, a fast-moving river of air high in the **atmosphere**, called the jet stream, can help guide wetter storms across the Southwest. NASA said this storm system also drew energy from unusually warm ocean water.

This story matters beyond one reservoir. In Earth science, water is always moving through the water cycle: ocean, air, clouds, rain, rivers, snow, and groundwater. In real life, that cycle affects roads, homes, farms, wildlife, and decisions made by dam managers and emergency officials. Satellite images help people see those changes as they happen, but they do not make the choices easy. A storm can be both relief and danger at the same time.

Written from reporting by NASA.

THINK IT THROUGH

1. **When a dry region gets sudden heavy rain, should officials focus more on saving as much water as possible or reducing flood danger? Defend your choice.**

   > **A strong answer:** A strong answer should weigh drought relief against public safety and recognize that dam and river decisions involve trade-offs.

2. **How does seeing a reservoir from a satellite change what people can understand compared with only seeing it from the ground?**

   > **A strong answer:** A strong answer should discuss scale, comparison over time, and the limits of satellite images without local observations.

3. **What information would be missing if someone only heard that the drought had improved after these storms?**

   > **A strong answer:** A strong answer should note that drought improvement does not show flood damage, long-term water shortages, snowpack history, or risks to communities.

ATMOSPHERE CAPACITY CLIMATE DROUGHT RAINFALL
RESERVOIR RUNOFF SATELLITE SNOWMELT WATERSHED

Southwest Storms Fill a Reservoir—and Bring Flood Risk

ACROSS

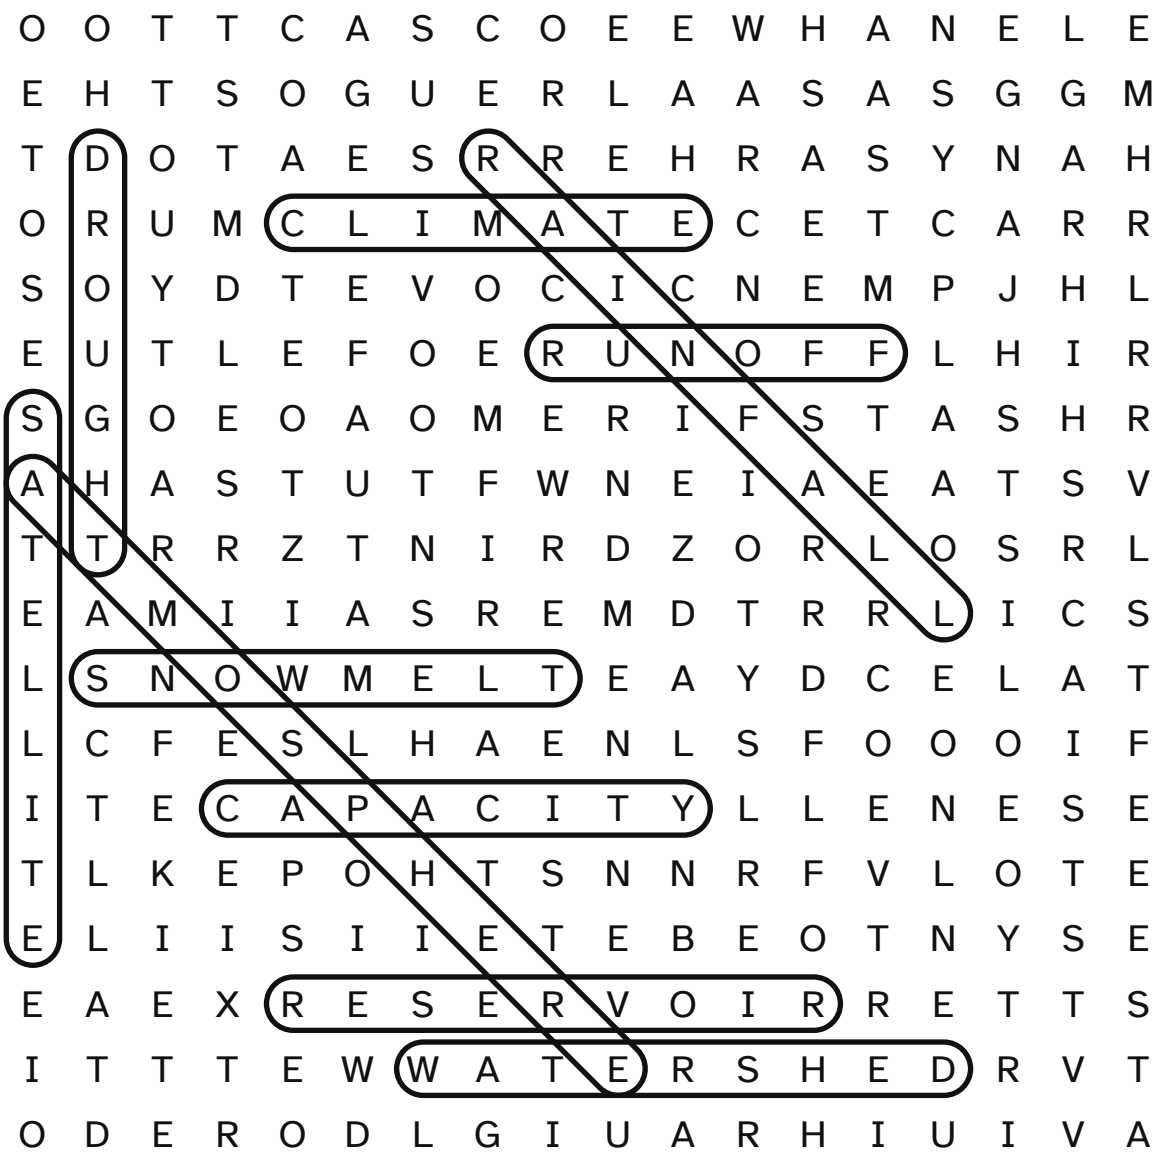

- **3** Water flowing over land into streams and rivers after precipitation
- **4** Layer of gases surrounding Earth
- **8** Land area draining toward the same river, lake, or sea
- **9** Water released when mountain ice crystals turn liquid in warm weather
- **10** Greatest amount a container, lake, or other place can hold

DOWN

- **1** Long period with much less precipitation than usual
- **2** Usual weather pattern in a place over many years
- **5** Space object circling Earth that gathers images and data
- **6** Large natural or human-made lake used to store water
- **7** Amount of water falling from clouds in a place over a certain time

Southwest Storms Fill a Reservoir—and Bring Flood Risk

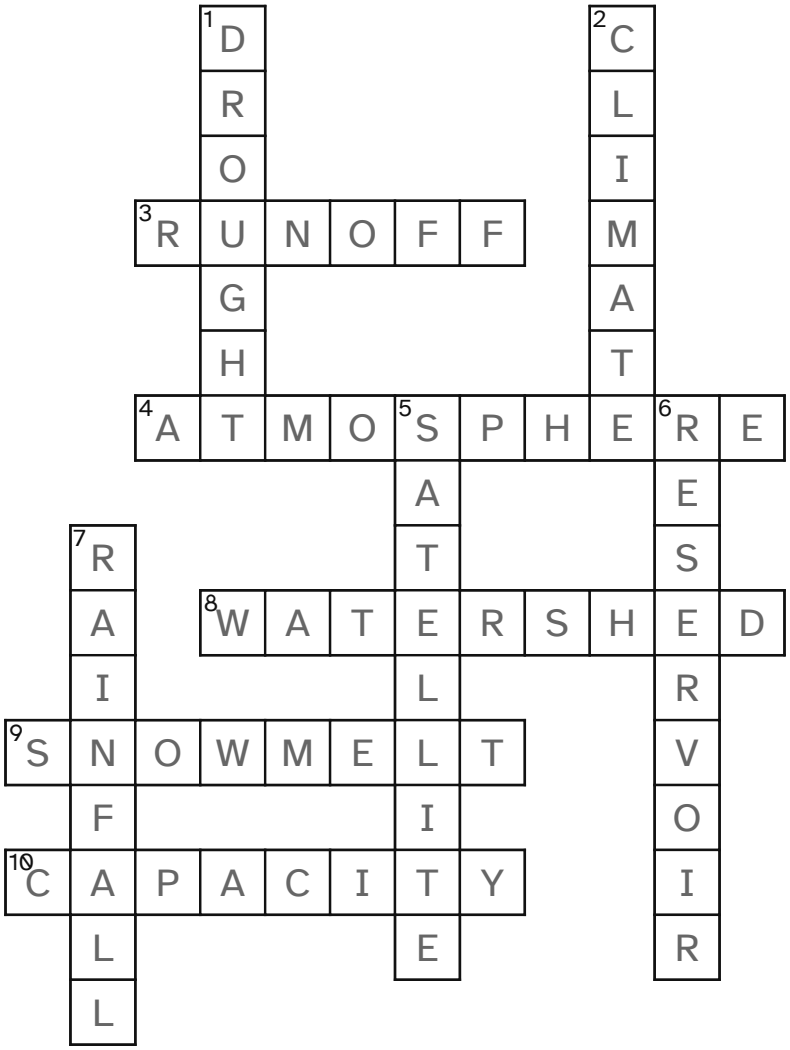

— answer key

ATMOSPHERE CAPACITY CLIMATE DROUGHT RAINFALL
RESERVOIR RUNOFF SATELLITE SNOWMELT WATERSHED

Southwest Storms Fill a Reservoir—and Bring Flood Risk

— answer key

ACROSS

3 Water flowing over land into streams and rivers after precipitation

4 Layer of gases surrounding Earth

8 Land area draining toward the same river, lake, or sea

9 Water released when mountain ice crystals turn liquid in warm weather

10 Greatest amount a container, lake, or other place can hold

DOWN

1 Long period with much less precipitation than usual

2 Usual weather pattern in a place over many years

5 Space object circling Earth that gathers images and data

6 Large natural or human-made lake used to store water

7 Amount of water falling from clouds in a place over a certain time

Where this came from

WHAT IS IN THIS PACKET

The article with a note on each question, a word search, a crossword, and the answer key to both.

COPYING AND REUSE

Free to print, copy and hand out for classroom use. Please keep this page with the packet, so the next teacher can see where the story came from.

More where this came from

If this short lesson worked for your class, our full workbooks go further with the same care:

- Complete units with student and teacher editions
- Worked solutions for every exercise
- Standards-aligned, classroom-tested, print-ready
